

Art Unit: 2616

Continuation of 3. Note: Regarding claims 1, 21, and 42, the modifications (as seen below) to the claims comprising *a subset of the set of time slots*, require the Examiner to perform an updated search. In addition, new claim 47 is added without canceling a number of finally rejected claims.

1. **(Currently Amended) A method for allocating time slots to channels in a time division multiplexed network in which a bitstream divided into frames is propagating, wherein a recurrent frame thereof is divided into time slots, and in which circuit-switched channels are allocated respective sets of time slots in said recurrent frame of said network, said method comprising the steps of:**
 - allocating a set of time slots to a circuit-switched first channel;**
 - associating the allocated set of time slots to said first channel with a first level of priority;**
 - receiving a request for time slots for a circuit-switched second channel associated with a second level of priority;**
 - comparing said first and second levels of priority, and**
 - determining whether or not to deallocate a subset of said set of time slots from said first channel, and allocate the deallocated subset of time slots to said second channel, based upon said comparison.**
